R Markdown

Introduction

Final Remarks

According to the American Physical Society:

*Science is the systematic enterprise of gathering knowledge about the universe and organizing and condensing that knowledge into **testable laws and theories**. The **success and credibility of science** are anchored in the **willingness of scientists to expose their ideas and results to independent testing and replication by other scientists***

R Markdown

Introduction

Final Remarks

Reproducible Research (RR) in Computational Sciences

The data and the code used to make a finding are available and they are sufficient for an independent researcher to recreate the finding

R Markdown

Introduction

Final Remarks

Figure 2 : Adam Smith, author of *The Wealth of Nations* (1776), in which he conceptualizes the notion of the division of labour

Division of Labour

Composition and logical structuring of text is the author's specific contribution to the production of a printed text. Matters such as the choice of the font family, should section headings be in bold face or small capitals? Should they be flush left or centered? Should the text be justified or not? Should the notes appear at the foot of the page or at the end? Should the text be set in one column or two? and so on, is the typesetter's business

The Genius Behind L^AT_EX

Figure 3 : The T_EX project was started in 1978 by Donald Knuth (Stanford). He planned for 6 months, but it took him nearly 10 years to complete. Coined the term “Literate programming”: mixture of code and text segments that are “human” readable. Recipient of the Turing Award (1974) and the Kyoto Prize (1996).

R Markdown
Introduction
Final Remarks

Compiling a .Rnw document

The two steps on previous slide can be executed in one command:

```
knitr::knit2pdf()
```

or in RStudio:

Incorporating R code

- Insert R code in a **Code Chunk** starting with

<< >>=

and ending with

@

006-sensitivity-
analysis

R Markdown
Introduction
Final Remarks

- Include R output within the text
- We can do that with “S-expressions” using the command `\Sexpr{...}`

Example:

The iris dataset has `\Sexpr{nrow(iris)}` rows and
`\Sexpr{ncol(iris)}` columns

produces

The iris dataset has 150 rows and 5 columns

Include a Figure
